

Scan Report

July 28, 2021

Summary

This document reports on the results of an automatic security scan. All dates are displayed using the timezone “Coordinated Universal Time”, which is abbreviated “UTC”. The task was “Metasploitable scan”. The scan started at Wed Jul 28 18:58:14 2021 UTC and ended at . The report first summarises the results found. Then, for each host, the report describes every issue found. Please consider the advice given in each description, in order to rectify the issue.

Contents

1	Result Overview	2
2	Results per Host	2
2.1	172.17.0.3	2
2.1.1	High 80/tcp	3
2.1.2	High 5900/tcp	7
2.1.3	High general/tcp	8
2.1.4	High 513/tcp	8
2.1.5	High 1524/tcp	9
2.1.6	High 514/tcp	10
2.1.7	High 6200/tcp	10
2.1.8	High 3306/tcp	11
2.1.9	High 8787/tcp	12
2.1.10	High 21/tcp	13
2.1.11	High 512/tcp	14
2.1.12	Medium 80/tcp	14
2.1.13	Medium 25/tcp	25
2.1.14	Medium 23/tcp	33
2.1.15	Medium 445/tcp	34
2.1.16	Medium 2121/tcp	35
2.1.17	Medium 22/tcp	35
2.1.18	Medium 5900/tcp	37

2.1.19	Medium 21/tcp	37
2.1.20	Low 80/tcp	39
2.1.21	Low 22/tcp	40
2.1.22	Low general/tcp	40

Result Overview

Host	High	Medium	Low	Log	False Positive
172.17.0.3	15	28	3	0	0
Total: 1	15	28	3	0	0

Vendor security updates are not trusted.

Overrides are on. When a result has an override, this report uses the threat of the override.

Information on overrides is included in the report.

Notes are included in the report.

This report might not show details of all issues that were found.

It only lists hosts that produced issues.

Issues with the threat level “Log” are not shown.

Issues with the threat level “Debug” are not shown.

Issues with the threat level “False Positive” are not shown.

Only results with a minimum QoD of 70 are shown.

This report contains all 46 results selected by the filtering described above. Before filtering there were 322 results.

Results per Host

High (CVSS: 10.0) NVT: TWiki XSS and Command Execution Vulnerabilities
Summary The host is running TWiki and is prone to Cross-Site Scripting (XSS) and Command Execution Vulnerabilities.
Vulnerability Detection Result Installed version: 01.Feb.2003 Fixed version: 4.2.4
Impact Successful exploitation could allow execution of arbitrary script code or commands. This could let attackers steal cookie-based authentication credentials or compromise the affected application.
Solution Solution type: VendorFix Upgrade to version 4.2.4 or later.
Affected Software/OS TWiki, TWiki version prior to 4.2.4.
Vulnerability Insight The flaws are due to, - %URLPARAM}% variable is not properly sanitized which lets attackers conduct cross-site scripting attack. - %SEARCH}% variable is not properly sanitised before being used in an eval() call which lets the attackers execute perl code through eval injection attack.
Vulnerability Detection Method Details: TWiki XSS and Command Execution Vulnerabilities OID:1.3.6.1.4.1.25623.1.0.800320 Version used: \$Revision: 12952 \$

High (CVSS: 7.5) NVT: Tiki Wiki CMS Groupware < 4.2 Multiple Unspecified Vulnerabilities
Summary Tiki Wiki CMS Groupware is prone to multiple unspecified vulnerabilities, including: - An unspecified SQL-injection vulnerability - An unspecified authentication-bypass vulnerability - An unspecified vulnerability
Vulnerability Detection Result Installed version: 1.9.5 Fixed version: 4.2
Impact Exploiting these issues could allow an attacker to compromise the application, access or modify data, exploit latent vulnerabilities in the underlying database, and gain unauthorized access to the affected application. Other attacks are also possible.
Solution Solution type: VendorFix The vendor has released an advisory and fixes. Please see the references for details.
Affected Software/OS Versions prior to Tiki Wiki CMS Groupware 4.2 are vulnerable.
Vulnerability Detection Method Details: Tiki Wiki CMS Groupware < 4.2 Multiple Unspecified Vulnerabilities OID:1.3.6.1.4.1.25623.1.0.100537 Version used: \$Revision: 13960 \$

High (CVSS: 7.5)

NVT: phpinfo() output Reporting

Summary

Many PHP installation tutorials instruct the user to create a file called phpinfo.php or similar containing the phpinfo() statement. Such a file is often left back in the webserver directory.

Vulnerability Detection Result

The following files are calling the function phpinfo() which disclose potentially sensitive information:

<http://172.17.0.3/mutillidae/phpinfo.php>

<http://172.17.0.3/phpinfo.php>

Impact

Some of the information that can be gathered from this file includes:

The username of the user running the PHP process, if it is a sudo user, the IP address of the host, the web server version, the system version (Unix, Linux, Windows, ...), and the root directory of the web server.

Solution

Solution type: Workaround

Delete the listed files or restrict access to them.

Vulnerability Detection Method

Details: phpinfo() output Reporting

OID:1.3.6.1.4.1.25623.1.0.11229

Version used: \$Revision: 11992 \$

High (CVSS: 7.5)

NVT: PHP-CGI-based setups vulnerability when parsing query string parameters from php files.

Summary

PHP is prone to an information-disclosure vulnerability.

Vulnerability Detection Result

Vulnerable url: <http://172.17.0.3/cgi-bin/php>

Impact

Exploiting this issue allows remote attackers to view the source code of files in the context of the server process. This may allow the attacker to obtain sensitive information and to run arbitrary PHP code on the affected computer. Other attacks are also possible.

... continues on next page ...

...continued from previous page ...

Solution**Solution type:** VendorFix

PHP has released version 5.4.3 and 5.3.13 to address this vulnerability. PHP is recommending that users upgrade to the latest version of PHP.

Vulnerability Insight

When PHP is used in a CGI-based setup (such as Apache's `mod_cgid`), the `php-cgi` receives a processed query string parameter as command line arguments which allows command-line switches, such as `-s`, `-d` or `-c` to be passed to the `php-cgi` binary, which can be exploited to disclose source code and obtain arbitrary code execution.

An example of the `-s` command, allowing an attacker to view the source code of `index.php` is below:

`http://example.com/index.php?-s`

Vulnerability Detection Method

Details: PHP-CGI-based setups vulnerability when parsing query string parameters from `ph.`

NVT: Test HTTP dangerous methods

Summary

Misconfigured web servers allows remote clients to perform dangerous HTTP methods such as PUT and DELETE. This script checks if they are enabled and can be misused to upload or delete files.

Vulnerability Detection Result

We could upload the following files via the PUT method at this web server:

`http://172.17.0.3/dav/puttest1678299295.html`

We could delete the following files via the DELETE method at this web server:

`http://172.17.0.3/dav/puttest1678299295.html`

... continues on next page ...

...continued from previous page ...
Impact - Enabled PUT method: This might allow an attacker to upload and run arbitrary code on this web server. - Enabled DELETE method: This might allow an attacker to delete additional files on this web server.
Solution Solution type: Mitigation Use access restrictions to these dangerous HTTP methods or disable them completely.
Vulnerability Detection Method Details: Test HTTP dangerous methods OID:1.3.6.1.4.1.25623.1.0.10498 Version used: \$Revision: 9335 \$

High 5900/tcp

High (CVSS: 9.0) NVT: VNC Brute Force Login
Summary Try to log in with given passwords via VNC protocol.
Vulnerability Detection Result It was possible to connect to the VNC server with the password: password
Solution Solution type: Mitigation Change the password to something hard to guess or enable password protection at all.
Vulnerability Insight This script tries to authenticate to a VNC server with the passwords set in the password preference. It will also test and report if no authentication / password is required at all. Note: Some VNC servers have a blacklisting scheme that blocks IP addresses after five unsuccessful connection attempts for a period of time. The script will abort the brute force attack if it encounters that it gets blocked. Note as well that passwords can be max. 8 characters long.

↵b/drb.rb:1427:in 'run'"6/usr/lib/ruby/1.8/drb/drb.rb:1347:in 'initialize'"/us
↵r/lib/ruby/1.8/drb/drb.rb:1627:in 'new'"9/usr/lib/ruby/1.8/drb/drb.rb:1627:in
↵'start_service'"/usr/sbin/druby_timeserver.rb:12:errnoi+:mesg"Function not im
↵plemented
```

Impact

By default, Distributed Ruby does not impose restrictions on allowed hosts or set the \$SAFE environment variable to prevent privileged activities. If other controls are not in place, especially if the Distributed Ruby process runs with elevated privileges, an attacker could execute arbitrary system commands or Ruby scripts on the Distributed Ruby server. An attacker may need to know only the URI of the listening Distributed Ruby server to submit Ruby commands.

Solution**Solution type:** Mitigation

Administrators of environments that rely on Distributed Ruby should ensure that appropriate controls are in place. Code-level controls may include:

- Implementing taint on untrusted input
- Setting \$SAFE levels appropriately (>=2 is recommended if untrusted hosts are allowed to submit Ruby commands, and >=3 may be appropriate)

... continues on next page ...

...continued from previous page ...
- Including drb/acl.rb to set ACLEntry to restrict access to trusted hosts
Vulnerability Detection Method Send a crafted command to the service and check for a remote command execution via the instance_eval or syscall requests. Medium (CVSS: 5.0) NVT: Tiki Wiki CMS Groupware 'fixedURLData' Local File Inclusion Vulnerability
Summary ... continues on next page ...

...continued from previous page ...
The host is installed with Tiki Wiki CMS Groupware and is prone to a local file inclusion vulnerability.
Vulnerability Detection Result Installed version: 1.9.5 Fixed version: 12.11
Impact Successful exploitation will allow an user having access to the admin backend to gain access to arbitrary files and to compromise the application.
Solution Solution type: VendorFix Upgrade to Tiki Wiki CMS Groupware version 12.11 LTS, 15.4 or later.
Affected Software/OS Tiki Wiki CMS Groupware versions: - below 12.11 LTS - 13.x, 14.x and 15.x below 15.4
Vulnerability Insight The Flaw is due to improper sanitization of input passed to the 'fixedURLData' parameter of the 'display_banner.php' script.
Vulnerability Detection Method Checks if a vulnerable version is present on the target host. Details: Tiki Wiki CMS Groupware 'fixedURLData' Local File Inclusion Vulnerability OID:1.3.6.1.4.1.25623.1.0.108064 Version used: \$Revision: 11863 \$

Medium (CVSS: 5.0) NVT: Tiki Wiki CMS Groupware Input Sanitation Weakness Vulnerability
Summary The host is installed with Tiki Wiki CMS Groupware and is prone to input sanitation weakness vulnerability.
Vulnerability Detection Result ... continues on next page ...

...continued from previous page ...	
Installed version:	1.9.5
Fixed version:	2.2
Impact Successful exploitation could allow arbitrary code execution in the context of an affected site.	
Solution Solution type: VendorFix Upgrade to version 2.2 or later.	
Affected Software/OS Tiki Wiki CMS Groupware version prior to 2.2 on all running platform	
Vulnerability Insight The vulnerability is due to input validation error in tiki-error.php which fails to sanitise before being returned to the user.	
Vulnerability Detection Method Details: Tiki Wiki CMS Groupware Input Sanitation Weakness Vulnerability OID:1.3.6.1.4.1.25623.1.0.800315 Version used: \$Revision: 14010 \$	
References CVE: CVE-2008-5318, CVE-2008-5319 Other: URL: http://secunia.com/advisories/32341 URL: http://info.tikiwiki.org/tiki-read_article.php?articleId=41	
Medium (CVSS: 5.0) NVT: awiki Multiple Local File Include Vulnerabilities	
Summary awiki is prone to multiple local file-include vulnerabilities because it fails to properly sanitize user-supplied input.	
Vulnerability Detection Result Vulnerable url: http://172.17.0.3/mutillidae/index.php?page=/etc/passwd	
Impact An attacker can exploit this vulnerability to obtain potentially sensitive information and execute arbitrary local scripts in the context of the webserver process. This may allow the attacker to compromise the application and the host. Other attacks are also possible.	
Solution Solution type: WillNotFix	
... continues on next page ...	

...continued from previous page ...
No known solution was made available for at least one year since the disclosure of this vulnerability. Likely none will be provided anymore. General solution options are to upgrade to a newer release, disable respective features, remove the product or replace the product by another one.
Affected Software/OS awiki 20100125 is vulnerable. Other versions may also be affected.
Vulnerability Detection Method Details: awiki Multiple Local File Include Vulnerabilities OID:1.3.6.1.4.1.25623.1.0.103210 Version used: \$Revision: 10741 \$

Medium (CVSS: 4.8) NVT: Cleartext Transmission of Sensitive Information via HTTP
Summary The host / application transmits sensitive information (username, passwords) in cleartext via HTTP.
Vulnerability Detection Result The following input fields were identified (URL:input name): http://172.17.0.3/phpMyAdmin/:pma_password http://172.17.0.3/phpMyAdmin/?D=A:pma_password http://172.17.0.3/tikiwiki/tiki-install.php:pass http://172.17.0.3/twiki/bin/view/TWiki/TWikiUserAuthentication:oldpassword
Impact An attacker could use this situation to compromise or eavesdrop on the HTTP communication between the client and the server using a man-in-the-middle attack to get access to sensitive data like usernames or passwords.
Solution Solution type: Workaround Enforce the transmission of sensitive data via an encrypted SSL/TLS connection. Additionally make sure the host / application is redirecting all users to the secured SSL/TLS connection before allowing to input sensitive data into the mentioned functions.
Affected Software/OS ... continues on next page ...

...continued from previous page ...
Hosts / applications which doesn't enforce the transmission of sensitive data via an encrypted SSL/TLS connection.
Vulnerability Detection Method Evaluate previous collected information and check if the host / application is not enforcing the transmission of sensitive data via an encrypted SSL/TLS connection. The script is currently checking the following: - HTTP Basic Authentication (Basic Auth) - HTTP Forms (e.g. Login) with input field of type 'password' Details: Cleartext Transmission of Sensitive Information via HTTP OID:1.3.6.1.4.1.25623.1.0.108440 Version used: \$Revision: 10726 \$

Medium (CVSS: 4.3) NVT: phpMyAdmin 'error.php' Cross Site Scripting Vulnerability
Summary The host is running phpMyAdmin and is prone to Cross-Site Scripting Vulnerability.
Vulnerability Detection Result Vulnerability was detected according to the Vulnerability Detection Method.
Impact Successful exploitation will allow attackers to inject arbitrary HTML code within the error page and conduct phishing attacks.
Solution Solution type: WillNotFix No known solution was made available for at least one year since the disclosure of this vulnerability. Likely none will be provided anymore. General solution options are to upgrade to a newer release, disable respective features, remove the product or replace the product by another one.
Affected Software/OS phpMyAdmin version 3.3.8.1 and prior.
Vulnerability Insight The flaw is caused by input validation errors in the 'error.php' script when processing crafted BBcode tags containing '@' characters, which could allow attackers to inject arbitrary HTML code within the error page and conduct phishing attacks.
Vulnerability Detection Method Details: phpMyAdmin 'error.php' Cross Site Scripting Vulnerability OID:1.3.6.1.4.1.25623.1.0.801660 Version used: \$Revision: 11553 \$

Medium (CVSS: 4.3)

NVT: TWiki 'organization' Cross-Site Scripting Vulnerability

Summary

The host is running TWiki and is prone to cross site scripting vulnerability.

Vulnerability Detection Result

Vulnerable url: http://172.17.0.3/twiki/bin/view/Main/CccCcc

... continues on next page ...

...continued from previous page ...
Impact Successful exploitation will allow remote attackers to insert arbitrary HTML and script code, which will be executed in a user's browser session in the context of an affected site.
Solution Solution type: WillNotFix No known solution was made available for at least one year since the disclosure of this vulnerability. Likely none will be provided anymore. General solution options are to upgrade to a newer release, disable respective features, remove the product or replace the product by another one.
Affected Software/OS TWiki version 5.1.1 and prior
Vulnerability Insight The flaw is due to an improper validation of user-supplied input to the 'organization' field when registering or editing a user, which allows attackers to execute arbitrary HTML and script code in a user's browser session in the context of an affected site.
Vulnerability Detection Method Details: TWiki 'organization' Cross-Site Scripting Vulnerability OID:1.3.6.1.4.1.25623.1.0.802391 Version used: \$Revision: 13659 \$

Version used: \$Revision: 11103 \$

Medium (CVSS: 5.0)

NVT: Check if Mailserver answer to VRFY and EXPN requests

Summary

The Mailserver on this host answers to VRFY and/or EXPN requests.

Vulnerability Detection Result

'VRFY root' produces the following answer: 252 2.0.0 root

Solution**Solution type:** Workaround

Disable VRFY and/or EXPN on your Mailserver.

For postfix add 'disable_vrfy_command=yes' in 'main.cf'.

For Sendmail add the option 'O PrivacyOptions=goaway'.

It is suggested that, if you really want to publish this type of information, you use a mechanism that legitimate users actually know about, such as Finger or HTTP.

Vulnerability Insight

VRFY and EXPN ask the server for information about an address. They are inherently unusable through firewalls, gateways, mail exchangers for part-time hosts, etc.

Vulnerability Detection Method

Details: Check if Mailserver answer to VRFY and EXPN requests

OID:1.3.6.1.4.1.25623.1.0.100072

Version used: \$Revision: 13470 \$

Medium (CVSS: 4.3)

NVT: SSL/TLS: 'DHE_EXPORT' Man in the Middle Security Bypass Vulnerability (LogJam)

Summary

This host is accepting 'DHE_EXPORT' cipher suites and is prone to man in the middle attack.

Vulnerability Detection Result

'DHE_EXPORT' cipher suites accepted by this service via the SSLv3 protocol:

TLS_DHE_RSA_EXPORT_WITH_DES40_CBC_SHA

TLS_DH_anon_EXPORT_WITH_DES40_CBC_SHA

TLS_DH_anon_EXPORT_WITH_RC4_40_MD5

'DHE_EXPORT' cipher suites accepted by this service via the TLSv1.0 protocol:

TLS_DHE_RSA_EXPORT_WITH_DES40_CBC_SHA

... continues on next page ...

...continued from previous page ...
TLS_DH_anon_EXPORT_WITH_DES40_CBC_SHA TLS_DH_anon_EXPORT_WITH_RC4_40_MD5
Impact Successful exploitation will allow a man-in-the-middle attacker to downgrade the security of a TLS session to 512-bit export-grade cryptography, which is significantly weaker, allowing the attacker to more easily break the encryption and monitor or tamper with the encrypted stream.
Solution Solution type: VendorFix - Remove support for 'DHE_EXPORT' cipher suites from the service - If running OpenSSL update to version 1.0.2b or 1.0.1n or later.
Affected Software/OS - Hosts accepting 'DHE_EXPORT' cipher suites - OpenSSL version before 1.0.2b and 1.0.1n
Vulnerability Insight Flaw is triggered when handling Diffie-Hellman key exchanges defined in the 'DHE_EXPORT' cipher suites.
Vulnerability Detection Method Check previous collected cipher suites saved in the KB. Details: SSL/TLS: 'DHE_EXPORT' Man in the Middle Security Bypass Vulnerability (LogJam) OID:1.3.6.1.4.1.25623.1.0.805188 Version used: \$Revision: 11872 \$

Medium (CVSS: 4.3) NVT: SSL/TLS: Deprecated SSLv2 and SSLv3 Protocol Detection
Summary It was possible to detect the usage of the deprecated SSLv2 and/or SSLv3 protocol on this system.
... continues on next page ...

...continued from previous page ...
Vulnerability Detection Result In addition to TLSv1.0+ the service is also providing the deprecated SSLv2 and SSLv3 protocols and supports one or more ciphers. Those supported ciphers can be found in the 'SSL/TLS: Report Weak and Supported Ciphers' (OID: 1.3.6.1.4.1.25623.1.0.802067) NVT.
Impact An attacker might be able to use the known cryptographic flaws to eavesdrop the connection between clients and the service to get access to sensitive data transferred within the secured connection.
Solution Solution type: Mitigation It is recommended to disable the deprecated SSLv2 and/or SSLv3 protocols in favor of the TLSv1+ protocols. Please see the references for more information.
Affected Software/OS All services providing an encrypted communication using the SSLv2 and/or SSLv3 protocols.
Vulnerability Insight The SSLv2 and SSLv3 protocols containing known cryptographic flaws like: - Padding Oracle On Downgraded Legacy Encryption (POODLE, CVE-2014-3566) - Decrypting RSA with Obsolete and Weakened eNcryption (DROWN, CVE-2016-0800)
Vulnerability Detection Method Check the used protocols of the services provided by this system. Details: SSL/TLS: Deprecated SSLv2 and SSLv3 Protocol Detection OID:1.3.6.1.4.1.25623.1.0.111012 Version used: \$Revision: 5547 \$
References CVE: CVE-2016-0800, CVE-2014-3566 Other: URL: https://www.enisa.europa.eu/activities/identity-and-trust/library/deliverables/algorithms-key-sizes-and-parameters-report URL: https://bettercrypto.org/ URL: https://mozilla.github.io/server-side-tls/ssl-config-generator/ URL: https://drownattack.com/ URL: https://www.imperialviolet.org/2014/10/14/poodle.html
Medium (CVSS: 4.0) NVT: SSL/TLS: Diffie-Hellman Key Exchange Insufficient DH Group Strength Vulnerability
Summary The SSL/TLS service uses Diffie-Hellman groups with insufficient strength (key size < 2048). ... continues on next page ...

...continued from previous page ...
Vulnerability Detection Result Server Temporary Key Size: 512 bits
Impact An attacker might be able to decrypt the SSL/TLS communication offline.
Solution Solution type: Workaround Deploy (Ephemeral) Elliptic-Curve Diffie-Hellman (ECDHE) or use a 2048-bit or stronger Diffie-Hellman group (see the references). For Apache Web Servers: Beginning with version 2.4.7, mod_ssl will use DH parameters which include primes with lengths of more than 1024 bits.
Vulnerability Insight The Diffie-Hellman group are some big numbers that are used as base for the DH computations. They can be, and often are, fixed. The security of the final secret depends on the size of these parameters. It was found that 512 and 768 bits to be weak, 1024 bits to be breakable by really powerful attackers like governments.
Vulnerability Detection Method Checks the DHE temporary public key size. Details: SSL/TLS: Diffie-Hellman Key Exchange Insufficient DH Group Strength Vulnerability. ↔.. OID:1.3.6.1.4.1.25623.1.0.106223 Version used: \$Revision: 12865 \$

Medium (CVSS: 6.0) NVT: Samba MS-RPC Remote Shell Command Execution Vulnerability (Active Check)
Summary Samba is prone to a vulnerability that allows attackers to execute arbitrary shell commands because the software fails to sanitize user-supplied input.
Vulnerability Detection Result Vulnerability was detected according to the Vulnerability Detection Method.
Impact An attacker may leverage this issue to execute arbitrary shell commands on an affected system with the privileges of the application.
Solution Solution type: VendorFix Updates are available. Please see the referenced vendor advisory.
Affected Software/OS This issue affects Samba 3.0.0 to 3.0.25rc3.
Vulnerability Detection Method Send a crafted command to the samba server and check for a remote command execution. Details: Samba MS-RPC Remote Shell Command Execution Vulnerability (Active Check) OID:1.3.6.1.4.1.25623.1.0.108011 Version used: \$Revision: 10398 \$

Medium (CVSS: 4.8)

NVT: FTP Unencrypted Cleartext Login

Summary

The remote host is running a FTP service that allows cleartext logins over unencrypted connections.

Vulnerability Detection Result

The remote FTP service accepts logins without a previous sent 'AUTH TLS' command ↩. Response(s):

Anonymous sessions: 331 Password required for anonymous

Non-anonymous sessions: 331 Password required for openvas-vt

Impact

An attacker can uncover login names and passwords by sniffing traffic to the FTP service.

Solution

Solution type: Mitigation

Enable FTPS or enforce the connection via the 'AUTH TLS' command. Please see the manual of the FTP service for more information.

Vulnerability Detection Method

Tries to login to a non FTPS enabled FTP service without sending a 'AUTH TLS' command first and checks if the service is accepting the login without enforcing the use of the 'AUTH TLS' command.

Details: FTP Unencrypted Cleartext Login

OID:1.3.6.1.4.1.25623.1.0.108528

NVT: SSH Weak Encryption Algorithms Supported

... continues on next page ...

...continued from previous page ...	
Summary	The remote SSH server is configured to allow weak encryption algorithms.
Vulnerability Detection Result	<p>The following weak client-to-server encryption algorithms are supported by the remote service:</p> <pre>3des-cbc aes128-cbc aes192-cbc aes256-cbc arcfour arcfour128 arcfour256 blowfish-cbc cast128-cbc rijndael-cbc@lysator.liu.se</pre> <p>The following weak server-to-client encryption algorithms are supported by the remote service:</p> <pre>3des-cbc aes128-cbc aes192-cbc aes256-cbc arcfour arcfour128 arcfour256 blowfish-cbc cast128-cbc rijndael-cbc@lysator.liu.se</pre>
Solution	<p>Solution type: Mitigation</p> <p>Disable the weak encryption algorithms.</p>
Vulnerability Insight	<p>The ‘arcfour’ cipher is the Arcfour stream cipher with 128-bit keys. The Arcfour cipher is believed to be compatible with the RC4 cipher [SCHNEIER]. Arcfour (and RC4) has problems with weak keys, and should not be used anymore.</p> <p>The ‘none’ algorithm specifies that no encryption is to be done. Note that this method provides no confidentiality protection, and it is NOT RECOMMENDED to use it.</p> <p>A vulnerability exists in SSH messages that employ CBC mode that may allow an attacker to recover plaintext from a block of ciphertext.</p>
Vulnerability Detection Method	<p>Check if remote ssh service supports Arcfour, none or CBC ciphers.</p> <p>Details: SSH Weak Encryption Algorithms Supported</p> <p>OID:1.3.6.1.4.1.25623.1.0.105611</p> <p>Version used: \$Revision: 13581 \$</p>

NVT: VNC Server Unencrypted Data Transmission

Summary

The remote host is running a VNC server providing one or more insecure or cryptographically weak Security Type(s) not intended for use on untrusted networks.

Vulnerability Detection Result

The VNC server provides the following insecure or cryptographically weak Security Type(s):

2 (VNC authentication)

Impact

An attacker can uncover sensitive data by sniffing traffic to the VNC server.

Solution

Solution type: Mitigation

Run the session over an encrypted channel provided by IPsec [RFC4301] or SSH [RFC4254]. Some VNC server vendors are also providing more secure Security Types within their products.

Vulnerability Detection Method

Medium (CVSS: 6.4) NVT: Anonymous FTP Login Reporting
Summary Reports if the remote FTP Server allows anonymous logins.
Vulnerability Detection Result It was possible to login to the remote FTP service with the following anonymous ↪account(s): anonymous:anonymous@example.com ftp:anonymous@example.com
Impact Based on the files accessible via this anonymous FTP login and the permissions of this account an attacker might be able to: - gain access to sensitive files - upload or delete files.
Solution Solution type: Mitigation If you do not want to share files, you should disable anonymous logins.
Vulnerability Insight A host that provides an FTP service may additionally provide Anonymous FTP access as well. Under this arrangement, users do not strictly need an account on the host. Instead the user typically enters 'anonymous' or 'ftp' when prompted for username. Although users are commonly asked to send their email address as their password, little to no verification is actually performed on the supplied data.
Vulnerability Detection Method Details: Anonymous FTP Login Reporting OID:1.3.6.1.4.1.25623.1.0.900600 Version used: \$Revision: 12030 \$
References Other: URL: https://web.nvd.nist.gov/view/vuln/detail?vulnId=CVE-1999-0497

Medium (CVSS: 4.8) NVT: FTP Unencrypted Cleartext Login
Summary The remote host is running a FTP service that allows cleartext logins over unencrypted connections.
Vulnerability Detection Result The remote FTP service accepts logins without a previous sent 'AUTH TLS' command ... continues on next page ...

...continued from previous page ...
↔. Response(s): Anonymous sessions: 331 Please specify the password. Non-anonymous sessions: 331 Please specify the password.
Impact An attacker can uncover login names and passwords by sniffing traffic to the FTP service.
Solution Solution type: Mitigation Enable FTPS or enforce the connection via the 'AUTH TLS' command. Please see the manual of the FTP service for more information.
Vulnerability Detection Method Tries to login to a non FTPS enabled FTP service without sending a 'AUTH TLS' command first and checks if the service is accepting the login without enforcing the use of the 'AUTH TLS' command. Low 22/tcp

Low (CVSS: 2.6) NVT: SSH Weak MAC Algorithms Supported
Summary The remote SSH server is configured to allow weak MD5 and/or 96-bit MAC algorithms.
Vulnerability Detection Result The following weak client-to-server MAC algorithms are supported by the remote s ↪ervice: hmac-md5 hmac-md5-96 hmac-sha1-96 The following weak server-to-client MAC algorithms are supported by the remote s ↪ervice: hmac-md5 hmac-md5-96 hmac-sha1-96
Solution Solution type: Mitigation Disable the weak MAC algorithms.
Vulnerability Detection Method Details: SSH Weak MAC Algorithms Supported OID:1.3.6.1.4.1.25623.1.0.105610 Version used: \$Revision: 13581 \$

[\[return to 172.17.0.3 \]](#)

Low general/tcp

Low (CVSS: 2.6) NVT: TCP timestamps
Summary The remote host implements TCP timestamps and therefore allows to compute the uptime.
Vulnerability Detection Result It was detected that the host implements RFC1323. The following timestamps were retrieved with a delay of 1 seconds in-between: Packet 1: 3409651950 Packet 2: 3409653042
Impact A side effect of this feature is that the uptime of the remote host can sometimes be computed.
Solution Solution type: Mitigation To disable TCP timestamps on linux add the line 'net.ipv4.tcp_timestamps = 0' to /etc/sysctl.conf. Execute 'sysctl -p' to apply the settings at runtime. To disable TCP timestamps on Windows execute 'netsh int tcp set global timestamps=disabled' Starting with Windows Server 2008 and Vista, the timestamp can not be completely disabled. The default behavior of the TCP/IP stack on this Systems is to not use the Timestamp options when initiating TCP connections, but use them if the TCP peer that is initiating communication includes them in their synchronize (SYN) segment. See the references for more information.
Affected Software/OS TCP/IPv4 implementations that implement RFC1323.
Vulnerability Insight The remote host implements TCP timestamps, as defined by RFC1323.
Vulnerability Detection Method Special IP packets are forged and sent with a little delay in between to the target IP. The responses are searched for a timestamps. If found, the timestamps are reported. Details: TCP timestamps OID:1.3.6.1.4.1.25623.1.0.80091 Version used: \$Revision: 14310 \$
